

1. Open your own laptop or desktop (or use an online PC hardware simulator if you don't have access to a real system) and identify the GPU model installed. Write down the GPU's brand, model number, and whether it is integrated or dedicated.

GPU Identification Report

Brand: Intel

Model Number: Intel UHD Graphics

Manufacturer: Intel Corporation

Type: Integrated GPU

Details:

The system uses Intel UHD Graphics, which is integrated into the Intel Core i5-1235U processor. It shares system memory (RAM) instead of having dedicated video memory. This GPU is suitable for everyday tasks, video playback, online learning, office work, and light gaming.

Result:

GPU successfully identified as Intel UHD Graphics (Integrated).

2. Take a clear photo or screenshot of the cooling system (fan, heatsink, or liquid cooling setup) inside your PC or from a PC hardware simulator. Label the main cooling components and briefly describe their function.

3.Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

Feature	Air Cooling	Liquid Cooling
Cost	Less expensive	More expensive
Cooling Efficiency	Good for normal gaming and daily use	Better for high-end gaming and heavy workloads
Maintenance	Very low maintenance	Requires regular maintenance and monitoring
Installation	Easy to install	More complex to install
Noise Level	Can be noisier under heavy load	Usually quieter during operation
Space Requirement	Takes less space	Requires extra space for radiator and tubing
Best Use Case	Mid-range gaming PCs and general users	High-performance gaming PCs, overclocking, and workstations

4.Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3-4 sentences based on your research.

My Choice: Liquid Cooling for the GPU

If I were building a gaming PC for streaming IPL matches and playing graphics-heavy games, I would choose **liquid cooling** for the GPU. Liquid cooling provides better cooling efficiency and keeps the GPU temperature lower during long gaming and streaming sessions. It is also generally quieter than air cooling when the system is under heavy load. Although liquid cooling is more expensive and requires more maintenance, it offers better performance and stability for high-end gaming and streaming.
